

A Swiss Company for
GLOBAL PERIO SOLUTIONS

presents:

INNOVATIVE COLLAGEN HYDROGEL

For the treatment of periodontal and peri-implant pockets.

WHAT IS H42®

A collagen hydrogel that protects and repairs

H42® is an innovative collagen hydrogel **with controlled biological properties, consistency, malleability and adhesiveness**, makes it suitable to adapt perfectly to the shape of the periodontal/peri-implant pockets.

H42® USES UNIQUE TECHNOLOGY

H42® was created through Exur-Teck®, a unique innovative technological process developed by Bioteck® that allows the combination of natural components such as collagen of equine origin, with resorbable polymers and ancillary amounts of ascorbic acid featuring a viscomodulating property.

WHY H42® IS UNIQUE?

IT PERFECTLY ADHERES TO TISSUE:

with its special composition, contact with tissue is optimal and non-aggressive.

IT FILLS EVENLY THE POCKET:

it seals and prevents bacterial recolonisation for 15-30 days.

IT IS RESORBABLE:

it is not necessary to remove it, as it is eliminated naturally without leaving any residue.

IT IS BIOLOGICAL:

the collagen component physiologically supports tissue repair.

BENEFITS

PREVENTS BACTERIAL RECOLONISATION

Creates a seal that isolates the treated pocket from the surrounding environment, preventing a second infection from occurring.

FACILITATES THE NATURAL HEALING OF GINGIVAL TISSUES

As it is free from aggressive ingredients and contains a collagen component that acts as a substrate for cell colonisation, H42® creates an environment that promotes the natural healing of the patient's tissue.

USABLE WITH A WIDE RANGE OF NEEDLES

The special properties of H42® in terms of fluidity and consistency make it suitable for being used with a wide range of needles most commonly used in dental surgery.

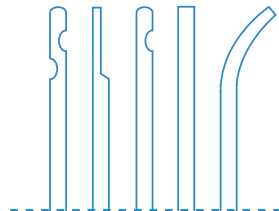

USER FRIENDLY

It does not require special storage and transport conditions, is ready for use, and the **Luer Lock** connection allows easy and safe connection to the needle.

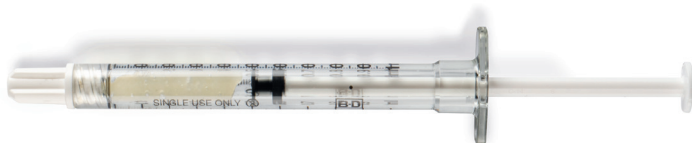

H42-304 Hydrogel Oral
3 syrs 0.4 cc/syr

USABLE NEEDLES

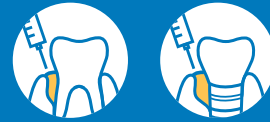

The H42® syringe features a male **Luer Lock** connection for easy and secure connection with a wide range of gauge needles ranging from 22 to 27 (needle diameter 0.70 to 0.40 mm) with multiple holes or single hole, lateral or frontal.

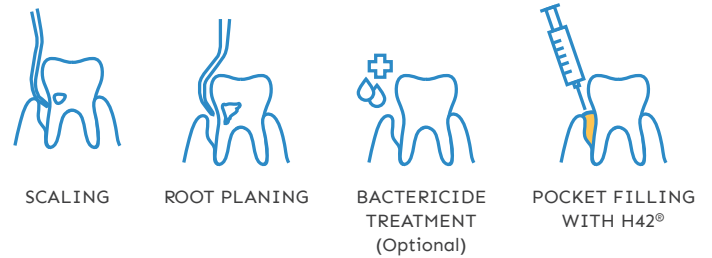

WHEN IS IT USED?

H42® is the innovative collagen-based hydrogel that aids in the treatment of periodontal and peri-implant pockets.

ONLY ONE APPLICATION IS NEEDED TO OBTAIN ALL OF THE ADVANTAGES OF H42®

After mechanical instrumentation of the piece to be treated, be it a dental element or implant, and any further decontamination treatment, keep the site dry and fill the pocket by injecting H42® starting from the pocket floor. Keep the site dry after application. Then follow the normal post-operative procedure.
