to the World!

Dear Parent!

If you are holding this brochure in your hands, you've made a very important step towards supporting the healthy development of your child. You have taken the time, got informed, you're paying attention to, and taking care of your child.

You, like every parent, know and love your child the most. Your child is your pride and joy, but he/she comes with a great responsibility. Sometimes admitting to ourselves that we feel, perceive that something isn't quite right, is the hardest part.

It is important to recognize those symptoms which though are cute, and look nice on a picture, but in reality, are inhibiting healthy development, or might even have detrimental effect on your child's health.

It is problematic if your child:

- pushes his/her tongue out a little while eating
- has dark circles under the eye in the morning, because he/she hasn't slept well
- has difficulty waking up, or is grumpy in the morning
- pushes out his/her tongue when talking, or swallowing
- can't close his/her mouth comfortably
- their upper and lower teeth don't meet, caused by prolonged pacifier use, or thumb sucking
- grinds his/her teeth during sleep
- either of his/her dental arc is overly protruding
- is breathing through his/her mouth
 - it is difficult to understand his/her speech
 - his/her mouth is open while watching cartoons
 - is frequently tired
 - snores
 - is sleeping with an open mouth

What is the solution?

The **U Concept Bio Trainer** product family is an orthodontic device, made of soft silicone, which assists in getting rid of bad habits, and helps in correcting the already developed anomalies.

A great advantage of this device line is that the treatment can be started from the **age of 3** and can be utilized until reaching adulthood, thanks to this your child's treatment can be started in time, this way we can prevent the development, and worsening of complex problems.

Why is the trainer a good solution:

- comfortable, as it is made of soft silicone
- pain free
- has no harmful side effect
- there is no need for dental impression taking
- pain free consultation
- visible change

When should we start treatment?

The longer a bad habit is present, the more significant the damage it is causing. That is why it is important to start the treatment as soon as possible.

It is crucially important that we mustn't wait with starting the orthodontic treatment until every permanent tooth is erupted.

Prevention is important.

We'd like to help you to notice if an issue is present, to recognize the factors that later might cause health problems, that can adversely influence your child's development.

The **early recognition and correction** of bad habits, and functions, are of great significance in providing a healthy growth environment for your child.

Recognize early, act in time!

What are the positive effects of the appliances:

By normalizing the breathing (nose breathing), and the tongue posture, the **sleep will be more peaceful**, and restorative. **School performance increases**, and the **behavioural disturbances** caused by the lack of quality sleep **can decrease**. A well-rested child can perform **better in school**, **discipline problems can decrease**. With the wearing of the trainer appliance there will be more place for the permanent teeth. **The device has beneficial influence on the head, and overall body posture**. With early orthodontic treatment the child's self-image will be healthier as well.

How can we achieve good results?

Both the child's, and parents' motivation is essential, to the successful treatment with a trainer, but perseverance will provide the expected results. Determination, and a bit of time will help you reach your goal.

It is easy you just have to use the trainer!

The key to success is in the usage.

Before

8 years old
baseline condition

After

6 months after

Unfortunately, the common misconception of you only need to visit an orthodontist after all permanent teeth are erupted is still prevalent. Nowadays it is still typical for orthodontists to first meet their young patients near the end of their growth period, when **there is no milk teeth** left. But by this time, they can only treat the already **present dental anomalies**, when **the possibilities are much more limited**. With fixed appliances the orthodontist can only move teeth within the already formed jawbone, which draws distinct boundaries to the achievable results.

If the patient to be treated is well **before puberty**, we can treat with much simpler techniques, which is more beneficial for both the patients as well as for the dentist. In early years, from as young **as 3 years of age**, but even **from 6-8 years of age**, dentists have a wide variety of removable orthodontic devices at their disposal, to guide the growth of the bone structure in the desired direction.

The **U Concept Bio Trainer** device family, belongs to this removable early treatment appliance group, with its soft material it provides a **comfortable** wearing experience, and an **effective system** when worn diligently.

It is a perfect solution for children, as they don't have to undergo unpleasant dental impression taking, wearing is pain free, and they can choose from different colours.

Inquire, and get informed, to gain knowledge of the available effective solutions, and who can help you and your child accessing them.

Our aim is to provide every child with a pain, and fear free, healthy development.

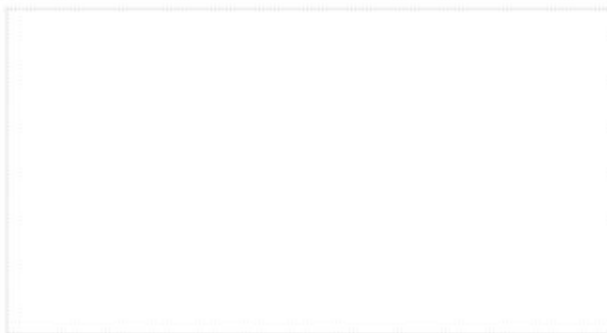

**Let's take care of your child's health
together, start orthodontic treatment
in time!**

The **U Concept** Bio Trainer product family will
help you!
